Concept of Vidradhi WSR to abscess: an ayurvedic review

Shriniwas Gujjarwar, Poonam Arya*

ABSTRACT

Ayurveda, a characteristic arrangement of medication, started in India over 3,000 years prior. The term Ayurveda is taken from the Sanskrit words ayur (life) and veda (science or information). In this manner, Ayurveda means information on life. In the wake of Collecting the information from various samhitas, ayurvedic texts and current books. Acharya sushruta- the father of Indian surgery has logically characterized in a foundational way an abundance of clinical material and the standards of the board for vidradhi, which are legitimate even today. “Sheegra vidhahivat’ meaning of vidradhi itself recommends the destructiveness of the disease. Vidradhi word is advanced from vidra, i.e, a painful condition like pricking, stabbing or cutting sensation in the skin. The infection Vidradhi (abscess) is a typical infirmity disturbing mankind and debilitate the victim for his standard work. It presents as a limited expanding with torment, red discoloration, local rise of temperature, delicacy and confined capacity of impacted part. it is normal in India with second most noteworthy frequency because of helpless disinfection, stuffing and deficient sustenance. Around the world, roughly 40-50 million individuals are contaminated every year with amoebic abscesses. The current exploration article is intended for relative investigation of Vidradhi and Abscess as far as Samprapti (Pathophysiology), Lakshanas (Clinical elements) and Chikitsa (Treatment) affirms that Vidradhi and Abscess can be comparable disease entities.

Keywords: Vidradhi, Abscess, Darana karma, Shashtikarmas

INTRODUCTION

Vidradhi, Abscess, Darana karma, Shashtikarmas

INTRODUCTION

Acharya sushruta – “Sheegra vidhahivat” meaning of vidradhi itself recommends the destructiveness of the illness. Exasperated doshas vitiate the skin, blood, muscle, fat and bone tissues, get limited and produce an irksome enlarging, which gradually inflamed, deep rooted, is painful and round.\(^1\) This is vidradhi.

Abscess is a localized collection of pus and a limited assortment of discharge in a depression shaped from tissues that have been separated by irresistible bacteria.\(^2\) An abscess is caused when such microscopic organisms as staphylococci or streptococcus admittance to strong tissue (e.g., through a little injury on the skin).\(^3\)

The toxins delivered by these duplicating microorganisms obliterate cells and, in this way, trigger an intense irritation at the site, with its trademark indications of redness, pain, expanding, and heat.\(^4\)
**Review of literature**

Review of ayurvedic literature

**Etymological deductions**

Vidradhi = vidra+ dha +i

The word vidradhi is gotten from:

Vidra = root word (Dhatu) and Dha implies is to “have”

I: it is append in line of word ”vidradhi”. Nirukti; which cause dha for example causing flushing sensation is called as ”vidradhi”. Paribhasa (definition): severe incendiary profound, painfull, round or level enlarging is known as vidradhi. Nirukti: which cause daha for example causing flushing sensation is called as ”vidradhi”.

Paribhasa (definition): severe incendiary profound, painfull, round or level enlarging is known as vidradhi.

Nidana: Nidanas or causative elements can be separated into two sorts as- Samanya (General), Vishesh (Specific).

**Samprapti**

By indulging in to aharaja and viharaja nidanas, which cause vitiation of blood; the doshas getting exasperate cause vitiation of twacha, mamsa, meda, asthi, snayu, kandara and cause an enlarge bumpy swelling from them; either outside or inside the body arranged somewhere inside went with serious agony; beingeither round or wide, this is known as ‘vidradhi’. For kshataja vidradhi, Acharya sushruta and vagbahta clarified very unique samprapti.

Vata getting irritated by attack by weapons and so forth, or by inadmissible food sources. What's more, by dislodging the heat at the site of injury, prompts the exacerbation of pitta and rakta and leads to abscess, introducing side effects of pitta and rakta and delivering entanglements, auxiliary infections and disease.

**Historical review**

An detailed review comes from the period of Rigveda to the period of Bruhattrayees, vidradhi as disease is narrate in entire.

In Rigveda and Atharvaveda we can find only the name ere as in other samhita and sangraha, Nidana panchaka with management in detail is found clearly.

BHEDA and PRAKARA (Types): Vidradhi is manifestly divided into two types by acharya sushruta. This classification is based on rogamarga.

Bahaya (bahaya rogamarga)- 6 types (according to doshas)

Abhyantra (Abhyantra and Madhya rogamarga)- 10 types (according to location)

**Bahiya Vidradhi**

According to Acharya Sushruta and Ah, AS, BP, MN, YR, GN every acharyas mentioned 6 types but Acharya Charak has mentioned 4 types of vidradhi as he preclude raktaja and kshataja vidradhi.

Signs and symptoms are as follows:

**Abhyantra Vidradhi**

According to location in Shuustra samhita and madhav nidana there is 10 types of abhyantravidrithi described as follows:

Guda (anus), Bastimukha, Nabhi (umbilicus), Kukshi, Vankahana, Vrikka (kidney), Yakrit (liver), Pleeha (spleen), Hridya (Heart), Kloma.

According to charak Samhita: Abhyantra vidradhi are 9 types excluded guda vidradhi others are same as described in shuustra samhita. In vidradhi Nidana Chapter of Sushruta Samhita, there is no immediate reference of Ama, Pachyamana and Pakva stages and their clinical highlights. However, he clarify all trademark elements of these stages in Amapkvesheeya Adhyaya. It is important to distinguish canker in its various stages, because line of treatment changes starting with one phases then onto the next. Consequently, investigation of Ama-Pakva Lakshanas are obligatory.

**Upadravas**

If surgeon is not able to identify the therapeutic stage and incised in uripe stage cause: Destruction of muscle, veins, ligaments, joints, bones, excessive bleeding, pain, tearing, and other complications or development of traumatic abscess.

At the point when the doctor either by dread or obliviousness concludes the illness as unripe through it is ready, then, at that point, the discharge staying somewhere inside not getting an opening. makes a major tear above in its own place, prompting development of a sinus, then, at that point, it turns out to be either reparable with trouble or even serious or incurable.

Vidradhi as Updravas: Vidradhi can manifest as upadravas of other disease.

Prameha and Avarana.

Sadhyasadhyatava: vataj, pitaj, kaphaj, raktaj, or agantuja- sadhya (curable).

Sannipataj vidradhi- Asadhyaa (incurable).

Vidradhi caused by all three Doshas are fatal.
**Chikitsa**

In Amapakveshaneeya Adhyaya, Acharya Sushruta explains Saptoupakramas for Shopha, that can be even applicable to Vidradhi (abscess) also. The order for application of upakramas is as follows.

**Review of modern literature**

**Introduction**

Most of the abscesses are caused by infection and occasionally by chemical injury and other cause. Abscess may be acute or chronic.

If an abscess is intense its center is normally condensed and filled with the intricate liquid we call pus, framed from the liquefaction of necrotic tissue. If the abscess is persistent, it contains regularly dry like clay in light of the fact that the discharge become dried out and brittle as in caseous corruption of tuberculosis. An intense sore is encircled by intense aggravation.

A persistent abscess is normally isolated from encompassing tissue by a mass of stringy tissue, frequently with little irritation remaining. Some types of abscess is below the deep fascia outbreak and form collar-stud abscess.

**Derivation**

The word abscess is acquire from Latin word ‘abscessus’, which means for departure or going away.

**Definition**

An abscess is a circumscribed area of inflammation or an abnormal cavity that contains pus when matured.

Types
There are four kind of abscess seen in surgical practice.¹⁶

Pyogenic abscess, pyaemic abscess, metastatic abscess, cold abscess

*Pyogenic abscess*

It is a localized collection of pus in a cavity lined by granulation tissue, covered by pyogenic membrane. It contains pus in loculi. Pus contains dead WBC’s, multiplying bacteria toxins and necrotic material.

Mode of infection: Local extension, by lymphatics, blood stream or haematogenous.¹⁶

Pathophysiology: Pathological events are summarized below.¹⁷

General: Temperature is elevated. Occasionally when infection is more, then rigors can occur.

Local: Five traditional neighborhood signs are because of hyperaemia and provocative exudates.¹⁸

Increase in local temperature. Redness of the skin over the inflamed area. Tenderness. Swelling. Loss of function.

*Investigations*¹⁸

*Haematological examination*

Biochemical examination. Conventional radiology is helpful in abscess containing gas. Isotope scanning is helpful in locating collection of pus or site of infection by accumulation of radioactive Technetium after its intravenous injection. Mostly used as diagnostic tool in brain abscess, hepatic abscess and osteomyelitis. Conventional radiology is useful in abscess containing gas. Isotope filtering is useful in finding assortment of discharge or site of disease by collection of radioactive Technetium after its intravenous infusion. For the most part utilized as indicative apparatus in brain abscess hepatic abscess and osteomyelitis. Ultrasound is important in diagnosis in internal abscess. CT scan is particularly helpful to differentiate between abscess and tumour by showing necrotic centre in case of abscess.

*Treatment*¹⁸

There are two lines of treatment: conservative and operative.

*Conservative*

In initial stage, when the pus is not yet formed, conservative treatment can be advised.

Give rest to affected part and patient.¹⁸

Appropriate antibiotics like cefoperazone, amikacin, tobramycin.

Fresh blood transfusion, adequate hydration, parenteral nutrition.

*Operative*

When the pus formation occurred, it should be drained. A golden rule of a famous surgeon. ‘Where there is pus, let it out.’ By Incision and drainage (Hilton’s method).¹⁹
Pyaemic abscess

Description: The condition in which multiple abscess create from the contaminated emboli are called Pyaemic abscess. It is described by auxiliary foci of suppuration in different parts of the body. This is brought about by lodgment of septic emboli, comprising of bunch of living beings, tainted cluster or vegetation, framed as consequence of separating of contaminated clots. This condition is likewise connected with many conditions like acute osteomyelitis and acute bacterial endocarditis. Such pyaemia is additionally found in intense a ruptured appendix when infective emboli pass into the entry venous framework and cause portal pyaemia.

Treatment

Antibiotics and if need incision and drainage.

Metastatic abscess: it is an abscess which occurs as a spread from other abscess, for example, lung abscess causinf metastatic abscess in the brain.

Cold abscess

As the name suggest abscess is ‘cold’ and non–reacting to the nature. It does not produce hot and painful abscess as seen in pyogenic abscess. Brawny induration, oedema and tenderness are conspicuous by their absence. Only when they are associated with secondary infection a few of these features are present. Cold abscess is almost the sequel of tubercular infections anywhere in the body commonly in the lymph nodes.

As the name recommend abscess is ‘cold’ and non-responding to the nature. It doesn’t create hot and agonizing inflammation as seen in pyogenic abscess. Brawny induration, oedema and delicacy are prominent by their nonattendance.

Just when they are related with optional disease a couple of these highlights are available. Cold abscess is practically the continuation of tubercular diseases anyplace in the body normally in the lymph nodes.

Treatment

Once the diagnosis is authenticate, full antitubercular regime should be started. If the abscess persists in or to be present, aspiration may be attempted.

CONCLUSION

An review of litrature about Vidradhi and abscess with a comparative analysis (similar examination) as far as Samprapti (pathophysiology), Lakshanas (clinical feature) and Chikitsa (treatment) affirms that Vidradhi and Abscess can be practically identical infection substances.
